

Project Report „Butzbach high-speed-doors in baggage handling facilities“ **High Speed for Tough Daily Operation**

Door dimensions, skin colour and design of vision panels can be chosen individually.

Butzbach high speed doors stand for high reliability even in rough environment and under the influence of high-frequency traffic. Therefore numerous international airports (e.g. Basle, Paris, Copenhagen, Amsterdam, Zurich, Istanbul, Munich and Cologne) rely on our products in the baggage handling areas.

High availability is required, since damaged or faulty doors seriously disturb the traffic flow of this sensitive airport area. The horizontal, bi-parting opening principle with a speed of 2m/sec, protects the door from the most frequent damage, a crash while door is not entirely open. The complete clear height is available yet while door is moving, clear vision is granted since the vision panel remains on eye level at any time.

The well-proven electro-hydraulic drive unit as well as the solid steel frame complete the elaborate system and guarantee reliability, robustness and longevity of the construction. Butzbach NOVOSPRINT - the optimum solution for airports who are more focussed on maintaining customer service than maintaining doors.
